

Activity 1 — Build Your "About Me" Card

Time: ~25 minutes · **File you edit:** `App.js` · **Goal:** a profile card that's all about *you*, running on your phone.

You'll practice everything from today: **components**, **View / Text / Image**, **StyleSheet**, and **Flexbox**.

Before you start

Make sure your app is running:

```
git checkout session-1
npm install
npx expo start
```

Scan the QR with **Expo Go**. You should see a profile card. Now let's make it yours — open `App.js` in VS Code.

Keep the app open on your phone. Every time you **save**, it updates. Make one small change at a time.

Step-by-step

1 Make it your name

Find the `<Text style={styles.name}>` line and change it to **your name**. Save. See it change on your phone. 🎉

```
<Text style={styles.name}>Your Name Here</Text>
<Text style={styles.role}>Future Mobile Developer</Text>
```

2 Use your own photo

Swap the image URL, or use a fun avatar:

```
<Image
  style={styles.avatar}
  source={{ uri: 'https://i.pravatar.cc/300?img=5' }} // try numbers 1-70
/>
```

Want a local photo? Drop `me.jpg` into the `assets/` folder and use `source={require('./assets/me.jpg')}` (no `width / height` needed for local files, but keep the avatar style).

3 Write your bio

Change the text inside the bio box to a sentence or two about you:

```
<View style={styles.bioBox}>
  <Text style={styles.bioText}>
    Write something about yourself here. What do you like? Why are you here?
  </Text>
</View>
```

4 Fill in your three info rows

Each row uses `flexDirection: 'row'` to put the label and value **side by side**:

```
<View style={styles.infoRow}>
  <Text style={styles.infoLabel}>📍 Location</Text>
  <Text style={styles.infoValue}>Your City</Text>
</View>
```

Update all three rows (📍 Location, 🎓 School, 💡 Learning) with your real info.

✓ Checkpoints — you're done when...

- ☐ The card shows **your** photo, name, and role

- ☐ Your **bio** is in the rounded box
- ☐ **Three info rows** show, each with a label on the left and value on the right
- ☐ Everything is **centered** and nicely spaced (no text crammed in a corner)

☀️ Stretch goals (if you finish early)

1. **Change the theme color.** Edit `screen.backgroundColor` and `avatar.borderColor` to your favorite color.
2. **Perfect circle avatar.** It's already circular — try changing the size to `100` and fix `borderRadius` to `50`. What's the rule? (*half the size!*)
3. **Add a "Skills" row** of emojis: 🧠 📱 🎨 — a new `<View>` + `<Text>`.
4. **Add a shadow.** The card already has `elevation: 6` (Android). Try changing it to `12`.
5. **Add a second card** below the first (hint: copy the `<View style={styles.card}>` block — `ScrollView` lets you scroll).

😓 Stuck? Quick fixes

Problem	Try this
🔴 "Text strings must be rendered within a <code><Text></code> "	You have loose text — wrap it in <code><Text>...</Text></code>
Image won't show	Check the URL; make sure the <code>avatar</code> style has width & height
Red error screen	Read the line number at the top, look for a missing <code>}</code> , <code>></code> , or quote
Nothing updates	Press <code>r</code> in the terminal, or shake the phone → Reload

🏠 Take-home

Restyle your card and **add one brand-new section** — your hobbies, your favorite quote, or a row of skill emojis. Bring it next week.

Next session: we make this screen *come alive* — buttons, typing, and a To-Do list that grows. 🚀
